

a

Astrocyte proteostasis declines with pTDP burden

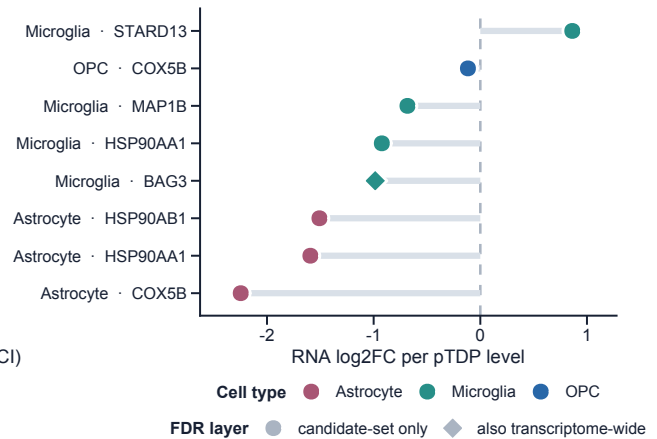

14 annotated Emory donors; global BH across 42 programme-by-cell-type tests

b

Candidate RNA trends

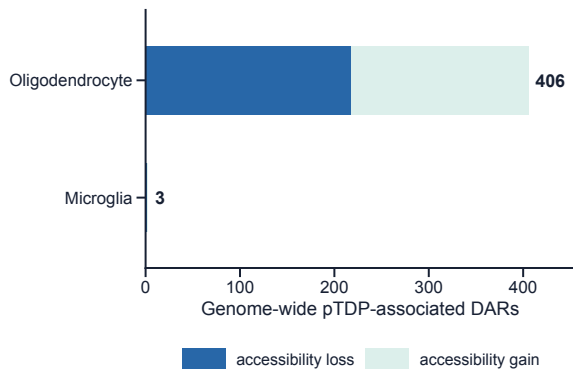

14 donors; 8 candidate-set signals, all 14/14 LOO;
BAG3 alone passes transcriptome-wide FDR

c

Detected accessibility differences are oligodendroglial

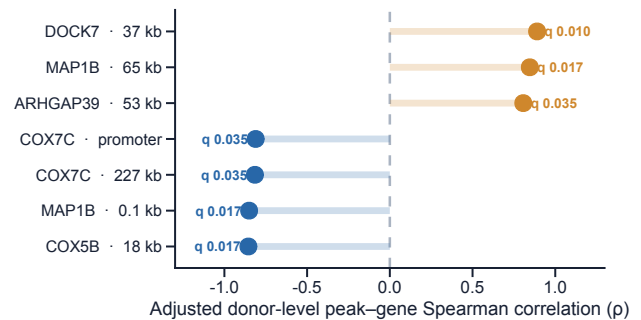

14 donors; 406 of 409 DARs occur in oligodendrocytes under the fitted model

d

Peak-gene associations

14 donors; 7 within-cell-type BH hits;
point estimates only (no frozen CI)

e

Joint-evidence gate

14 donors; RNA trends: 6 genes · peak-gene associations: 5 genes

Nearest-peak trends: 0 · complete chains: 0

	RNA pTDP trend	Peak-gene association	Nearest-peak pTDP trend	Complete three-part chain
